

**NEW Multiple-Joint Hinges –
in Aluminium or Stainless Steel**

Multiple joint hinges, also known as concealed hinges, are a new type of hinge for the construction sector.

Mounted inside the housing to save space and protect against vandalism, they allow opening angles of up to 180° on flaps, hatches and doors. This ensures that the inside of the housing is optimally accessible.

The concealed hinges are available in aluminium or stainless steel, each with three different opening angles (90°, 120° and 180°). The multiple-joint hinges can be adjusted in three planes with complementary spacer plates and plates with tapped holes or thread stud.

NEW VTT-HL Knobs

VTT- HL knobs are made of Glass-fibre reinforced polyamide based technopolymer, black coloured and with a mat finish. The hexagonal shank allows the handwheel to be tightened with a spanner, while the three-lobe shape with large recesses is particularly ergonomic also for smaller knobs, ensuring an effective grip even with work gloves. The full section design without rear cavities prevents the deposit of unsanitary residues, ensuring maximum cleanability and making the product particularly suitable for applications on machines and equipment subject to frequent cleaning with water or steam jets.
