

HCV-AX Oil Electrical Level Indicators

HCV-AX Oil Electrical level indicators are made in transparent polyamide based technopolymer. Highly resistant to shocks, the ultrasound welding guarantees a perfect seal. The newest HCV-AX Oil Electrical Level Indicators are the HCV-STL-AX, the HCV-ST-AX, the HCV-E-STL-AX and the HCV-E-ST-AX. The axial output of the electric sensors allows the use of these indicators even when lateral space on tank is minimum. The fluid level is visible even from side positions and the lens effect guarantees a better visibility of the fluid level.

Indexing Plungers GN 817.6 with Sensor

Indexing plungers very often fulfil safety functions – but this is not the only time when it is important to obtain feedback about their position. With the new series GN817.6, Ganter now also allows automated status checks.

The sensor electronics output a signal to a machine control and indicate the switch state with an LED on the sensor.
