

**PMC Spacer Plates for Hinges**

The PMC spacer plates allow hinges with different functions to be fitted on the same door, thus exploiting their features simultaneously.

Particularly, different types of spring hinges, detent hinges and hinges with safety switch can be fitted on the same door by means of the PMC. The “table of possible combinations “shows all the allowed combinations.

PMC spacer plates are made in die cast zinc alloy with epoxy resin coating, matte finish.

**Chemically Nickel-Plated Power Clamps**

Power clamps with the new chemically nickel-plated finish achieve high clamping forces even with small clamp sizes, which results in lower air consumption and weight reduction. The kinematic properties of the power clamps are designed so that the clamping force achieved in the clamped position is retained even after a loss of compressed air.

All power clamps come pre-equipped for end position detection via sensor.
